Project Name	CONTAINMENT_ZONE_ALERTING

CREATE API IN FLASK :

```
from flask import Flask app
= Flask(__name__)
@app.route("/") def
homepage():
    return "Hello Flask!" if __name__
== '__main__':    app.run()
```

The screenshot shows a Visual Studio Code editor window with a Python file named 'first.py'. The code in the file is:

```
1 from flask import Flask
2 app = Flask(__name__)
3 @app.route("/")
4 def homepage():
5     return "Hello Flask!"
6 if __name__ == '__main__':
7     app.run()
```

Below the editor, the 'TERMINAL' panel is open, showing the output of running the application. It displays the Windows PowerShell prompt, the command to run the application, and the output of the Flask application, which is 'Hello Flask!'. The terminal also shows the Flask version and the URL to access the application.

Hide Flank!
